Re: Adirondack Club and Resort;  
Project No. 2005-100;  
Proposed Amphibian Impact Analysis Plan

Dear Colleen:

Enclosed in outline form is a proposal by KT Wildlife, LLC to undertake an Amphibian Impact Analysis of those Resource Management lands with 800 feet of mapped wetlands located on the Eastern portion of the ACR project site (small Eastern Great Camp Lots and associated roadways).

Also enclosed is the data associated with the "Quantitative Amphibian Presence and Migration Surveys" also prepared by KT Wildlife, LLC.

These are being presented to you pursuant to paragraph 82 of the Agency's final Project Findings and Order No. 2005-100 and draft Permit 2005-100.4, Conditions 24, 25 & 26 ("Protection of Amphibians"). Condition 25 of that draft Permit provides:

"Based on the results of the biological survey, the Project Sponsor shall provide the Agency a detailed plan for an amphibian impact analysis. The plan shall include all the Biological Survey data collected and an analysis of the proposed development and an assessment of impacts. Prior to the undertaking of the Impact Analysis, the Project Sponsor shall submit a plan providing details to the Agency for review and approval. If approvable, the plan shall be authorized in writing by the Agency."

Thus, it is our understanding that based on this survey data and information and staff approval of the enclosed Plan, KT Wildlife, LLC will be undertaking the Impact Analysis. This Impact Analysis will establish whether additional best management practices and low cost mitigation techniques prior to construction should be applied to these limited areas of the project site to further reduce potential impacts to amphibian populations by further protecting habitat and facilitating amphibian movements. Any such additional low cost mitigation, if deemed desirable, would be authorized by an Agency letter of permit compliance.

We look forward to staff's acceptance of the enclosed documents.

Sincerely,

Thomas A. Ulasewicz

### Survey Overview

A comprehensive quantitative amphibian survey was conducted on all the Resource Management lands within the Eastern portion of the project site (Small Eastern Great Camp Lots; see “Materials and Methods”, *infra.*, second paragraph) that are located within 800 feet of delineated wetlands between 24 April and 12 May 2013. The 2013 spring amphibian migration season varies slightly year to year based on weather conditions. To maximize the success in finding emerging, migrating and breeding amphibians it is essential to survey during the best possible window. Amphibians will migrate in less than favorable condition if the weather is persistently unaccommodating. The 2013 spring season was delayed in much of the Northeast and upstate New York was not an exception. The survey period began on 24 April with a rainy spell during which amphibians were observed. However the temperatures began to drop significantly, and combined with dry weather and a late snowfall amphibian migration was put on hold, along with the surveys. The dry spell ended with rains around 9 May and the surveys resumed through the 12<sup>th</sup> with a fair number of common species of amphibians actively moving during the rain.

Table 1 shows the date, location, and species of the individuals captured and/or observed during the surveys in chronological order. Table 2 lists the amphibians by species with the dates and location of capture. Table 3 presents the weather conditions, and Table 4 summarizes the species observed and/or heard on each survey date and total numbers observed and imaged.

### Materials and Methods

All surveys were conducted between 24 April and 12 May, 2013 both during the daytime and night. During rainy conditions the survey was conducted through the entire overnight period. Surveys on rainy nights of Lake Simond Road, Lake Simond Ext and Ski Tow Road were conducted by both driving and walking to locate migrating amphibians. The bypass road and lots were surveyed on foot. The survey covered 11 days and/or nights. Photographs were taken *in situ* of most amphibians. Some were captured to be photographed the next day before release back at their locations due to heavy rain conditions which precluded the use of photographic equipment, due to water, fogging, etc. Date, time, location data, species and activity were recorded for individuals observed. Recordings were made of frogs calling in several locations on several dates.

Surveys were conducted of all project properties within 800 feet of delineated wetlands. The surveys included lots 20, 21, 22, 26, 29, 30 and 31 as shown on Plan Sheets LA 12, 13 and 15. Daytime reconnaissance surveys were conducted of this 800 foot buffer as well as the entire Small Eastern Great Camp Lots for the presence of vernal pools. Initial surveys included a wider

scope to better assess the amphibian populations and status in the general area. Dip nets were used to capture and identify larval amphibians and egg masses. Adult amphibians were captured by hand and net. Eleven pitfall traps were set in locations determined to have the highest probability to capture salamanders. Grid searches following the procedures outlined in the following guide were conducted each of the lots; *Measuring and Monitoring Biological Diversity: Standard Methods for Amphibians*. Edited by W. Ronald Heyer, Maureen A. Donnelly, Roy W. McDiarmid, Lee-Ann C. Hayek and Mercedes S. Foster. *Biological Diversity Handbook Series*, published by the Smithsonian Institution Press, 1994. This included random surveys of three 10mX10m blocks on each lot where the leaf litter was overturned and moist areas beneath shrubs were searched in addition to surface surveys. Roadside ditches present along the dirt portions of road, which function as vernal pools, were searched for evidence of amphibians and breeding.

### **Survey Results**

Surveys of lots 20, 21, and 22 yielded only eastern red-backed salamanders and one common garter snake, a common predator of these salamanders. There was no evidence of amphibian breeding on these lots and no vernal pools were located during the surveys. No amphibian activity was observed during the rainy night surveys of Lots 20, 21 and 22 adjacent to Read Road.

During reconnaissance surveys of lots 26, 29, 30, and 31 a vernal pool was located on lot 30. Initial surveys identified several other vernal pools outside the Small Eastern Great Camp Lots. The vernal pool on Lot 30, approximately 10' by 12', was photographed and the GPS location recorded. In addition to this pool, an old tire track rut functioned as a vernal pool on this lot also. Wood frog egg masses were found in both. Surveys during rainy nights on Lake Simond Road and Lake Simond Road Ext. produced wood frogs, green frogs, a bull frog, pickerel frogs, spring peepers, spotted salamanders, red spotted newts, and American toads. Surveys of lots 26, 29, 30 and 31 yielded eastern red-backed salamanders. Breeding calls of the wood frog, spring peepers and American toad were recorded. All egg masses located on and adjacent to the project site were identified as wood frog egg masses. During the duration of the survey period, larval amphibians emerged from the masses and were identified by dip netting as wood frog larvae. Green frog tadpoles from the previous year were observed in a nearby wetland.

No salamanders were captured in the pitfall traps. The random grid surveys through the leaf litter and forest floor on the project lots were unsuccessful in producing amphibians.

Roadside ditches along the unimproved Lake Simond Road Ext adjacent to lots 26, 29, 30 and 31 function as vernal pools and all of the identified common frog species were found in these ditches. Wood frog egg masses were abundant in these ditches. Two larval spring salamanders

were located in one of these ditches however, they eluded capture by hiding in the leaves underwater in the ditches. The location was recorded however no photographs were taken. It is estimated that about 75% of the amphibian breeding activity on these lots is occurring in the roadside ditches along the unimproved dirt road.

No endangered or threatened species of amphibians were located during the quantitative amphibian survey, only the ten common species listed here and shown in the tables. There were no concentrated areas of amphibian migration found during the surveys. The common frog species were distributed along the roadways with wood frog eggs common in the roadside ditches. Only four spotted salamanders were observed on Lake Simond Road on 24 April and none were observed during the warmer rainy weather commencing on 9 May. The absence of spotted salamander breeding activity and eggs masses on the Resource Management lands provided further evidence that breeding migrations are not occurring there. Based on the data collected, the Small Eastern Great Camp Lots can be assessed for potential impacts to local amphibian populations.

Table 3. Weather conditions during Adirondack Club and Resort Amphibian Surveys

Date	Survey Start	Survey End	Precipitation	Temperature Range
24-Apr-13	1430	2330	light rain	16°C to 8°C
25-Apr-13	1008	1830	rain previous night	4°C to 12.7°C
26-Apr-13	1200	1900	snow in am, then dry	7.2°C to 7.2°C
27-Apr-13	1200	1700	none	13°C to 19.2°C to 10°C
28-Apr-13	1300	1930	none	17°C to 19°C
29-Apr-13	1050	1900	overcast, no rain	18.3°C
30-Apr-13	1300	1900	none	15°C to 20°C
9 ,10-May-2013	2400	500	rain, then light rain	19°C to 7°C
10,11-May-2013	2100	500	rain	19°C to 10°C
11-May-13	1100	2000	heavy rain, dry later	16°C to 8°C
12-May-13	1100		sunny, windy, colder	4°C to 7°C

Table 4. Numbers and species catalogued and imaged during Adirondack Club and Resort Amphibian Survey

Date	Spring Peepers	Wood Frogs	Green Frogs	Spotted Salamanders	American Toads	Red backed Salamanders	Pickeral Frog	Common Garter	Spring Salamanders	Red Spotted Newt
24-Apr-13	calling, observed	calling, egg masses, observed	observed							
25-Apr-13	calling, observed	egg masses	tadpoles							
26-Apr-13	courtship observed	egg masses								
27-Apr-13	calling, observed	calling, egg masses, observed	observed							
28-Apr-13	calling, observed	observed, egg masses	observed							
29-Apr-13		egg masses					observed			
30-Apr-13	calling, observed	observed, egg masses	observed				observed			
9,10-May-2013	calling, observed	observed	observed				observed			
10,11-May-2013	calling, observed	observed	observed				observed			
11-May-13		observed egg masses, tadpoles					observed			
12-May-13							observed			
Total numbers	Numerous	45	4	8	26	4	2	2	3
